

Success Story: FRIO Dissolvable Frac Plug Success in East Texas

Intro

On March 22, 2024, Lonestar Completion Tools began a two well pad for a customer in the Carthage Field, located in East Texas.

Impact

After successfully using our FRIO dissolvable plug in previous wells for this customer, they chose to deploy FRIO plugs again, covering the wellbore from the toe to halfway through the lateral. Initially, the plan was to use our ONEplug composite plugs for the remaining part of the lateral. However, due to the exceptional performance observed during pump down and frac operations with the FRIO dissolvable plug, the customer opted to continue using FRIO plugs for the entire lateral.

Results

All frac operations were completed on April 4, 2024, and the coil units were rigged up on April 6th. The drill-out operations commenced later that evening and were finalized for both wells by late afternoon on April 8, 2024. The documented washout times were 13.25 hours for the first well and 13.78 hours for the second well.
